

Application note for the 15 pin package

The 15 pin package is comprised of a SemiNex submount fiber coupled into a 200um, 0.22NA single core fiber. The output power available is 5.5W to 7W depending on package selection. The standard termination is an SMA-905 connector. This application note is intended to help assist in determining different methods of driving and thermally cooling the package.

Package Specifications

The 15-pin package is designed for moderate optical powers transmitted from a single core optical fiber. The housing is a solid body, with electrically isolated feedthroughs and a single exit port for a fiber. The package is designed with four (4) through holes at the corners of the package which are to be used with four (4) M3 screws.

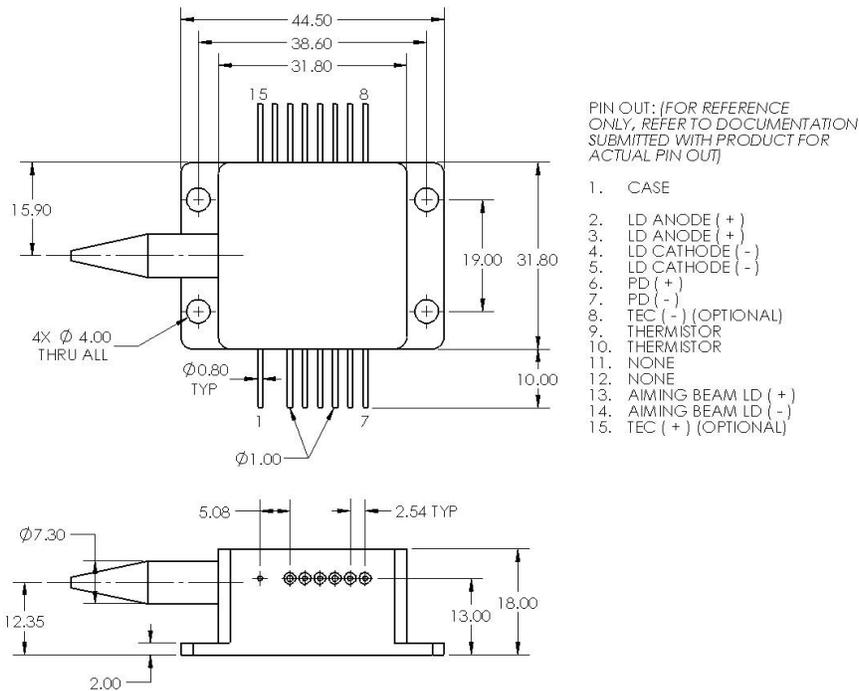

Figure 1. 15-pin package. Package specifications such as pinouts and options may change. Please contact SemiNex for your specific package and wiring configuration.

Thermistor (optional)

SemiNex uses an NTC type Thermistor with a constant of 3477 and a resistance of 10,000 Ohms.

Package Attachment

For optimal operation, the package should be attached to a temperature controlled mounting plate, such as a cold plate or TEC. Attaching the laser package requires 4, M3 screws. The mounting plate should be tapped with hole patterns to match those in figure 1. For long term use and highly efficient thermal transfer between the package and cooling plate or TEC, a layer of thermal grease or indium foil should be used. Recommended thermal greases are ShinEtsu Micro Si Product X23-7762, ShinEtsu Micro Si Product G751 or Artic Silver 5. Indium foil can be obtained from Indium Corp, part number ribbonin-10101. For short term operation (less than 1 minute), the use of thermal grease or indium can be avoided, but the temperature rise will be larger than with the grease or indium which will result in a decrease in optical power.

Attachment without thermal grease

Wipe the bottom of the package and top of the mounting plate with a clean cloth to remove any particles. Place the package on the mounting plate, align the holes and insert the screws into the package. Tighten the screws by securing one until a resistance is observed and repeat the process with the other screw. Return to the first screw and tighten with a torque wrench. Use caution to prevent over tightening. Do not exceed 5 in-pounds. Repeat with the second screw.

Attachment with Thermal Grease

Wipe the bottom of the package and top of the mounting plate with a clean cloth to remove any particles. Apply a small amount of grease to the bottom of the package. Spread the grease as evenly as possible using the roller or squeegee. Align the bolt holes of the package to the bolt holes in the mounting plate and secure with M3.5 screws. Tighten the screws as described above. Use caution to prevent over tightening. Do not exceed 5 in-pounds. Remove any excess grease using a towel.

Attachment with Indium Foil

Wipe the bottom of the package and top of the mounting plate with a clean cloth to remove any particles. Cut a small piece of foil approximately 30mm x 30mm and lay it on the mounting plate in the attachment location. Align the bolt holes of the package to the bolt holes in the mounting plate and secure with M3.5 screws. Tighten the screws as described above. Use caution to prevent over tightening. Do not exceed 5 in-pounds.

15-pin Package Operation

The 15-pin package has been tested prior to shipment while attached to a 20C cold plate using indium foil. A typical LIV at various test temperatures appears in figure 2.

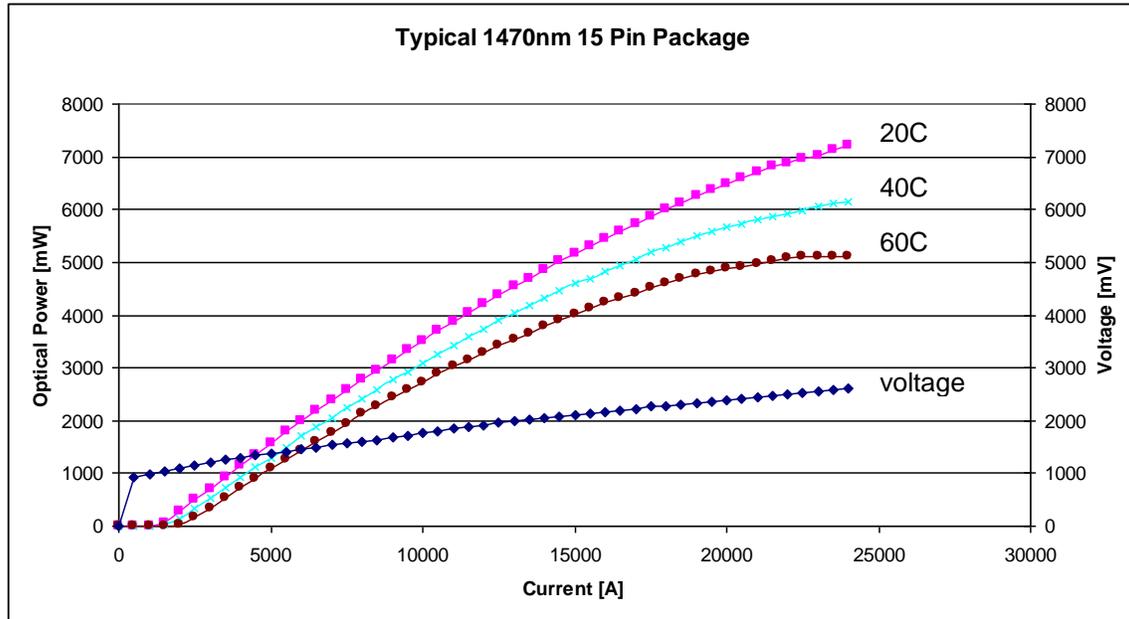

Figure 2. Typical LIV of a 1470nm 15-pin package at various base temperatures.

As seen in figure 2, proper heat sinking and maintaining of the base temperature is critical for achieving peak optical power performance. A recommended safe operating range is between 500mA and 90% of peak power. Peak power and slope will change with the mounting plate, plate and ambient temperatures.

15 Pin Package Laser Driver Requirements

When selecting the power supply, care should be taken to ensure electrical overstressing of the package can not occur. Overstressing occurs when a package is subjected to voltage or current levels beyond its' surge-absorbing capacity. Some recommended guidelines for preventing overstress of the package are:

- Overcurrent protection should be set to the current level at 100% of peak power.
- Use transient suppression for power supplies.
- Use over-voltage or voltage limiting protection
- Confirm packages are connected using the proper pin configurations.
- Ensure all wire used to connect to the package are of the proper gauge to sufficiently carry the desired drive current at the operational ambient temperature.
